Subject: NEWCO PROPOSAL FOR ARSENICAL WASTE DISPOSAL

Gary Martini of Newco called to let us know that their evaluation of a sample from our total arsenical waste stream leads them to believe that they can handle it in a water treatment plant they are constructing in Chester, PA. He indicated the plant could be in operation by March 1979, and was separate from their solids waste disposal site which we already know is being planned in the vicinity of Hazelton, PA.

In order to test their process, they are proposing that "pilot" quantities be shipped to them at their site at Niagara Falls, NY. They would probably charge some fee for this and give us a feasibility/cost proposal from that. He will forward details of this pilot proposal, as well as a secrecy agreement we would have to sign. Of course, they would want a long-term contract for waste disposal from us.

A proposal of this nature is considerably more attractive than merely for disposal of aniline water, since it could free us completely from the necessity of running the waste evaporation process. This would result in a labor savings as well as eliminating waste disposal of salt. It would also remove the waste disposal system as a potential bottleneck to expansion of the arsenilic acid plant.
